1 Overview

The MyriadPro package provides support for the MyriadPro font family from Adobe. You can use these fonts in a \LaTeX document by adding the command

```
\usepackage{MyriadPro}
```

to the preamble. This will change both the sans serif text font and the math font to MyriadPro. If you want to use MyriadPro as your main font, add

```
\renewcommand{\familydefault}{\sfdefault}
```

to your preamble. If you prefer another math font (such as eulervm), use the option `onlytext` as explained in Section 3. Together with the option `sansmath` which defines a sans and sansbold mathversion, this allows the usage of a complete MyriadPro setup consisting of text and math to be used in only a part of the document (see Section 4).

Acknowledgements

MyriadPro is heavily based on the MinionPro package by Achim Blumensath, Andreas Bühmann and Michael Zedler.

2 Interference with other packages

The MyriadPro package loads the following packages: `textcomp`, `amsmath`, `fontaxes` and `MdSymbol`. If you want to pass options to these packages you can either put the corresponding `\usepackage` command before the `\usepackage{MyriadPro}` or you can include the options in the `\documentclass` command. The MyriadPro package is *not* compatible with `amssymb` and `amsfonts`. Please see also the corresponding section in the `MdSymbol` documentation.

The MyriadPro package includes support files for the microtype package (version 1.8 or higher), consult the package's documentation for further details.

There is also a slight incompatibility with the `dcolum` package which expects all figures to have the same width. If you want to use this package you either have to specify the `mathtabular` option (this is the brute force solution, not recommended), or you can use the `\figureversion{tabular}` command to switch to tabular figures in front of every table (much better, but also more work). In addition, `dcolum` sets figures in math mode, hence the choice of math figures (see Section 3) determines if text or lining figures are used.

3 Options

Font selection

The following options specify which version of the fonts you want to use. The default settings are marked with an asterisk*.

<code>smallfamily*</code>	use only regular and bold face
<code>medfamily</code>	use semibold face in addition to <code>smallfamily</code>

The package also provides a way to only change the text fonts or only the math fonts. In addition, also additional font versions for sans serif math can be defined.

<code>onlytext</code>	only change the text fonts
<code>onlymath</code>	only change the math fonts
<code>sansmath</code>	provide mathversion <i>sans</i> and <i>sansbold</i> independently of options <code>onlytext</code> and <code>onlymath</code> and change <code>\mathsf</code> to use MyriadPro. This can be used together with <code>onlytext</code> to only use MyriadPro's math in a part of the document (see Section 4).

Figure selection

MyriadPro offers four different figure versions. A detailed description is given in Section 5. The default version can be selected by the following options:

<code>textosf</code>	use text figures in text mode
<code>mathosf</code>	use text figures in math mode
<code>osf*</code>	use text figures in text and math mode
<code>textlf</code>	use lining figures in text mode
<code>mathlf</code>	use lining figures in math mode
<code>lf</code>	use lining figures in text and math mode
<code>mathtabular</code>	use tabular figures in math mode

Calligraphic fonts

These options specify which font is used by the `\mathcal` command.

<code>cmsy*</code>	take the calligraphic symbols from Computer Modern: <i>ABC</i>
<code>abx</code>	use the calligraphic symbols provided by mathabx: <i>ABCabc</i> (This font contains also lowercase letters, but it is not quite finished.)
<code>crswash[=option]</code>	use the swash letters from CronosPro: <i>ABC</i> . <i>option</i> can be either <i>noptsmall</i> , <i>optsmall</i> , <i>noptmed</i> or <i>optmed</i> using (no) optical weights, small or medium family configuration (see CronosPro documentation). First one is default.

Blackboard bold letters

You can also select different fonts for the `\mathbb` command.

<code>amsbb*</code>	use the AMS blackboard font: <code>NZQRC</code>
<code>fourierbb</code>	use the Fourier blackboard font: <code>NZQRC</code>
<code>lucidabb</code>	use the (commercial) Lucida Math blackboard font

Greek letters

The following options specify whether you want to use upright or italic Greek letters in math mode.

<code>mixedgreek*</code>	uppercase Greek is upright, lowercase Greek is italic
<code>italicgreek</code>	all Greek letters are italic
<code>frenchmath</code>	all Greek letters and the uppercase Roman letters are upright

Upright and italic Greek letters are also directly accessible via the commands `\upgamma`, `\itgamma`, `\upGamma`, `\itGamma`, etc.

Miscellaneous options

<code>scale=</code> <i>factor</i>	scale the font size by <i><factor></i>
<code>loosequotes</code>	The quote signs of MyriadPro are set rather tight. This can lead to undesirable spacing for apostrophes. The <code>loosequotes</code> option slightly increases the side bearings of quotes. This option requires pdfTeX 1.40 and microtype 2.0. Beware that this option prevents hyphenation of words containing apostrophes. Such words will require explicit hyphenation commands <code>\-</code> .
<code>footnotefigures</code>	use special figures for footnote marks, i.e., <code>example^{6,9}</code> instead of <code>example^{6,9}</code> . This option can only be used if the footnote marks consist <i>solely</i> of figures.

4 Additional mathversions sans and sansbold

With the option `sansmath`, this package defines the additional mathversions `sans` and `sansbold`. They allow the usage of MyriadPro in math completely independent of the main math font. Also single input character symbols (e.g. `+`, `-`, `(`, `)`) adapt to the math version except when used with a delimiter size increasing command like `\big`.¹ As a workaround, use the corresponding full command instead (`\big\lparen`) (see `MdSymbol`).

Example: You want to use MyriadPro in table environments independently of the main

¹ Any help to solve this problem is highly welcome!

text and math fonts. Use the `onlytext` option to redefine the sans serif text font to MyriadPro and the `sansmath` option to define the additional math versions. Then use it in the following way:

```
\begin{table}
  \sffamily
  \mathversion{sans}
  ...
\end{table}
```

5 Figure selection and bold math symbols

MyriadPro offers four different figure versions. One can choose between *text figures* (lowercase figures) and *lining figures* (uppercase figures) and one can choose between *proportional* figures (figures with different widths) and *tabular* figures (all figures have the same width, useful mainly for tables).

	text figures	lining figures
proportional	o123456789	0123456789
tabular	o123456789	0123456789

The `\figureversion` command can be used to switch between different figure versions. Possible parameters are:

text, osf	text figures
lining, lf	lining figures
tabular, tab	tabular figures
proportional, prop	proportional figures

Usually it is desirable to set most text with proportional figures and to use tabular figures only in tables and lists. Unfortunately most \LaTeX document classes do not support fonts with several figure versions. Use the package `tabfigures` that patches some common document classes and packages (the standard \LaTeX classes, KOMA-Script, memoir, and amsmath) to use tabular figures at some places.

In addition to the `\mathsf` command, which produces bold symbols of Roman letters in math, MyriadPro offers the command `\boldsymbol`. It prints bold versions of Roman, Greek and other math symbols.

Example:

```
\boldsymbol{A} \boldsymbol{+} \boldsymbol{\beta} =
\boldsymbol{\mathcal{E}} \boldsymbol{\wedge}
\boldsymbol{\mathrm{H}} produces  $A + \beta = \mathcal{E} \wedge H$ .
```

6 Additional font shapes and symbols

The MyriadPro package provides all symbols from the `MdSymbol` package. Additionally, the following math symbols are available:

Ø	<code>\slashedzero</code>	κ	<code>\varkappa</code>	β	<code>\varbeta</code>
ε	<code>\backepsilon</code>	з	<code>\varbackepsilon</code>	ħ	<code>\hbar</code>
/	<code>\imath</code>	/	<code>\jmath</code>	ð	<code>\eth</code>
ℓ	<code>\Bbbk</code>				

Some of the alternative characters above resemble the normal character because MyriadPro offers no respective glyph. They are defined for compatibility reasons.

Small and slanted fractions are fractions with a height matching the font's body size. These are useful for typesetting, e.g., $\cos(\frac{1}{2}x + \frac{3}{2}y)$ or "1/12 litres of red wine" and can be accessed via

<code>\smallfrac{⟨numerator⟩}{⟨denominator⟩}</code>	$\frac{1}{3} \frac{5}{17}$
<code>\slantfrac{⟨numerator⟩}{⟨denominator⟩}</code>	$\frac{1}{3} \frac{5}{17}$

Note that *only* figures can be used for `⟨numerator⟩` and `⟨denominator⟩`.

7 Language support

The following encodings are supported:

Latin	ot1, t1, ts1, ly1, t5
Cyrillic	t2a, t2b, t2c, x2, ot2
Greek	lgr (to be used with babel, including polutonikogreek), lgi (lbycus transliteration scheme)

In order to typeset Greek text with the lbycus transliteration scheme, specify

```
\usepackage[ibycus,⟨otherlanguages⟩]{babel}
```

in the preamble and consult the documentation given in `ibycus-babel.pdf` on ctan. `\setgreekfontsize` is not supported.

8 Searching for figures or for words containing ligatures in pdf documents

Searching for figures or for words containing ligatures in pdf documents may not be possible depending on the way the pdf file was created. The following table gives an overview of which glyphs may cause problems.

font version	program	problems
1.000	Ghostscript, pre-1.40 pdf \TeX	LF/TOf, non-standard ligatures
1.001, 2.000	Ghostscript, pre-1.40 pdf \TeX	LF/OsF/TOf, ligatures
1.00x	Distiller, dvipdfmx	LF/TOf
1.00x	pdf \TeX 1.40	ok
2.000	Distiller, dvipdfmx, pdf \TeX 1.40	ok

To make figures and ligatures searchable when using pdf \TeX 1.40, you need to enable glyph-to-unicode translation and load the default mapping table:

```
\input glyphtounicode
\pdfgentounicode=1
```

See the pdf \TeX manual for details.

9 nfss classification

Parenthesised combinations are provided via substitutions.

encoding	family	series	shape
ot1, t1, ts1, ly1, t5	MyriadPro-OsF, MyriadPro-LF, MyriadPro-TOf, MyriadPro-TLF	m, b (sb, bx), eb	n, it (sl)
lgr, lgi, t2a, t2b, t2c, x2, ot2	MyriadPro-OsF, MyriadPro-LF, MyriadPro-TOf, MyriadPro-TLF	m, b (sb, bx), eb	n, it (sl)
oml	MyriadPro-TOf	m, b (sb, bx), eb	n, it
u	MyriadPro-Extra	m, b (sb, bx), eb	n, it (sl)

10 Version history

```

Font sets

The package MyriadPro-FontDef adapts the font definitions to the requested font set (see section 13). So we simply pass on the relevant options including the font scale factor; only MyriadPro integrals are handled here in MyriadPro.

```

13 Font definition files

As all the font definitions look the same we introduce macros to ease the configuration. These macros are stored in the file `MyriadPro-FontDef.sty` which is included by every `fd` file. Note that `MyriadPro-FontDef.sty` will be included several times and that we do not know in which context the code is executed. Therefore, we have to define all non-private commands as globals.

Since this package should be loadable in an `fd` file we have to avoid all `\preambleonly` commands. Therefore, we use `\ProvidesFile` instead of `\ProvidesPackage`.

We add a guard so that this file is executed only once even if it is included multiple times.

```

1010 \fontdef
1011 \ifx\My@DeclareFontShape\@undefined\else\endinput\fi

```

We distinguish between being loaded directly or via `\usepackage` in the preamble by checking `\@nodocument`.

```

1012 \ifx\@nodocument\relax
1013   \input{otfontdef.sty}
1014 \else
1015   \NeedsTeXFormat{LaTeX2e}
1016   \RequirePackage{otfontdef}
1017 \fi

```

Reset `\escapechar` (which is set to `-1` in `fd` files) to make `\newcommand` work. The additional group does not harm; we have to make the important commands global anyway.

```

1018 \ifx\@nodocument\relax
1019   \begingroup\escapechar'\
1020 \fi

```

These are the default values if it is impossible to process options.

```

1021 \newcommand\My@option@opticals{noopticals}
1022 \newcommand\My@option@fontset{smallfamily}
1023 \newdimen\My@option@normalsize
1024 \global\My@option@normalsize10pt

```

Whether we should adapt the configuration to the \normalsize of the document.
This switch is only needed locally.

```

1025 \newif\ifMy@option@normalsize
1026 \My@option@normalsizetrue
1027 \ifx\@nodocument\relax\else
1028   \DeclareOption{noopticals} {\let\My@option@opticals\CurrentOption}
1029   \DeclareOption{smallfamily} {\let\My@option@fontset\CurrentOption}
1030   \DeclareOption{medfamily} {\let\My@option@fontset\CurrentOption}
1031 %   \DeclareOption{fullfamily} {\let\My@option@fontset\CurrentOption}
1032   \DeclareOption{normalsize} {\My@option@normalsizetrue}
1033   \ExecuteOptions{smallfamily,noopticals,normalsize}
1034   \ProcessOptions\relax
1035 \fi

```

The method to determine the main font size is inspired by microtype's implementation.

```

1036 \ifMy@option@normalsize
1037   \begingroup
1038   \def\set@fontsize#1#2#3#4\@nil{%
1039     \@defaultunits\global\My@option@normalsize#2pt\relax\@nnil}%
1040   \normalsize\@nil
1041   \endgroup
1042 \fi

```

We use \otf@makeglobal from otfontdef to “export” the definitions that are needed globally.

```

1043 \otf@makeglobal{My@option@opticals}
1044 \otf@makeglobal{My@option@fontset}
1045 \ifx\@nodocument\relax\else
